1985 VITAL STATISTICS REPORT

PREPARED BY:

DEPARTMENT FOR HEALTH SERVICES
DIVISION OF STATE HEALTH PLANNING
HEALTH DATA BRANCH
FRANKFORT, KENTUCKY

INTRODUCTION

The 1985 Kentucky Vital Statistics Report represents a collection of the vital events that occurred to residents of the Commonwealth in 1985. Tables display data on resident births, deaths, marriages and divorces. The report also includes a table on occurrence births and one on occurrence deaths.

A few changes were implemented with this report. First, the section on 'out of wedlock' births has been incorporated with the birth section. These data are now referred to as 'nonmarried'. Second, whenever rates are used, a distinction is made as to whether the rate is crude, age specific, or age adjusted. Age specific rates may apply to either a single age or to an age cohort. The third change involves the arrangement of the report. The population data previously presented in the front of the report is now in the appendix section. Other sections have been moved up and retabled. One should refer to the table title in past reports when making comparisons between years.

The information in this report represents the only official source of vital statistics data in the Commonwealth of Kentucky. The data are collected from certified records of births, deaths, marriages and divorces by the Vital Statistics Branch of the Division for State Health Planning. The data are then supplied to the Division's Health Data Branch (State Center for Health Statistics) for publication. Because these data have wide circulation and use, many agencies will quote vital statistics data as if they were officially from their agency. Often the data have been changed to reflect a particular method of counting or calculating. The Center disclaims specifically any and all responsibility for any analyses, interpretations or conclusions which others may draw from these data.

There are two data limitations with regard to vital statistics. The data included in this report are based on 1985 certificates that were received by the Vital Statistics Branch before April 7, 1986. Any 1985 certificates received after that date are not included in this report. Additionally, some data represent what was reported to the official data collector at the time the certificate was completed and is dependent upon the respondent's recall. An example of this possible limitation is the actual trimester prenatal care began.

There is also a caveat concerning the use of the population data in the first part of the Appendix. The data shown in this vital statistics report are based upon 1984 final population estimates from the Kentucky State Data Center at the University of Louisville. Comparisons between the years 1980 and 1984 are possible due to their revisionary status. The population forecasts for 1985, 1990, 1995, 2000, 2010, and 2020 shown in the 1986 edition of 'How Many Kentuckians: Population Forecasts, 1980-2020', take into account the demographic impacts expected to result from the Toyota plant being constructed in Scott County, Kentucky. Users are advised to consider this difference when doing comparitive studies involving the two publications.

This report is organized into three major parts. The introduction, all narrative, and applicable analyses are located in the front of the report. The 1985 events are characterized and comparisons are made to previous years' data where applicable, and some mention is made of comparisons among the regions. The second part is divided into three

sections; births, deaths, and marriages and divorces. The birth and death tables are set up in two formats. The first format shows Kentucky data for the years 1985 back to 1980. In a few instances, data are displayed for years prior to 1980. The second format shows data for 1985 only, however the area coverage is more detailed. This format gives data for the Commonwealth, the Area Development Districts, and the counties within each district. The final part of the book is the appendix which contains population data, a glossary of vital statistics terms, a list of vital statistics rate definitions, a grams to pounds and ounces conversion chart, and photostatic copies of official birth, fetal death, and death certificates in order to provide the user with some idea of the type of data that is collected. Charts and graphs of various design have been included throughout the report.

The table formats displayed in this report are not an exhaustive representation of the various ways in which vital statistics data may be collated, nor is the maximum amount of detail provided. Requests for vital statistics data in formats or detail different from that which is provided in this report should be directed to the address or telephone number below. In addition, any relevant question, comment, or suggestion pertinent to this report should be sent to the same address.

1985 BIRTH STATISTICS ANALYSIS

The purpose of this section is to inform the reader of the major birth events that took place in Kentucky and its Area Development Districts in 1985. The birth data are classified according to several criteria relating to the mother and to the child. Criteria related to the mother include data on age and martial status, race, and the trimester prenatal care began. The race, sex, and birth weight of the child is also relevant to the analyses of vital statistic data.

There were 52,681 live births and 446 stillbirths in Kentucky in 1985. The live birth rate was 14.2 and the stillbirth rate was 8.5. Since 1980, both the actual number of live births and the birth rate have progressively declined. Nationally[1], the birth rate in 1985 was 15.7 live births per 1,000 population, unchanged from 1984. The total live birth rate in Kentucky in 1985 ranged from a low of 12.0 in both Districts 9 and 10 to a high of 16.9 in District 5. The white live birth rate was lowest in Districts 1 and 9 at 11.9 and highest in District 5 at 16.0. The live birth rate for nonwhite females was lowest in District 10 at 11.1 and highest in District 5 at 25.0. The nonwhite live birth rate was higher than the white birth rate in ten of the fifteen districts and equal in one. The 1985 total stillbirth rate ranged from a low of 5.4 in District 7 to a high of 12.6 in District 5. The white stillbirth rate was lowest in District 7 at 4.9 and highest in District 5 at 11.9. The stillbirth rate for nonwhites was lowest in District 4 at 4.5 and highest in District 14 at 58.8. See *Supplemental Table 1*.

BIRTH SUPPLEMENTAL TABLE 1

Nonwhite women have a higher live birth rate and stillbirth rate than white women. The birth rate for nonwhite women was 17.4 and the stillbirth rate was 14.0, while the comparable rates for white women were 13.9 and 7.9, respectively. Nonmarried women tend to have a lower live birth rate and a higher stillbirth rate among all women. The birth rate for all women was 14.2 and for nonmarried women it was 2.6. The stillbirth rate for nonmarried women was 10.9 as compared to a lower rate of 8.5 for all women. See *Supplemental Table* 2.

BIRTH SUPPLEMENTAL TABLE 2
BIRTH RATES BY MARITAL STATUS AND RACE

TOTAL WOMEN	BIRTH RATES	NONMARRIED WOMEN	BIRTH RATES
Total Birth Rate	14.2	Total Birth Rate	2.6
White Birth Rate	13.9	White Birth Rate	2.0
Nonwhite Birth Rate	17.4	Nonwhite Birth Rate	10.0
Total StillBirth Rate	8.5	Total StillBirth Rate	10.9
White StillBirth Rate	7.9	White StillBirth Rate	9.3
Nonwhite StillBirth Rate	14.0	Nonwhite StillBirth Rate	14.6

There is a higher percentage of women in the older child bearing age group than there were five years ago. The percentage of women 30-44 has increased from 18.47 percent in 1980 to 20.33 percent in 1984. Conversely there has been a decline in the percentage of women 15-29 during the same time period from 26.59 to 25.33 percent. In 1980 women 30-44 years of age became mothers to 15.67 pecent of all children born. By 1985 this percentage had edged up to 18.74 percent. There has been an approximate five percent drop in the number of children born to women ages 15 through 24. The percentage of children born to women 25-29 has remained relatively steady at 27.06 percent in 1980 and 29.17 percent in 1985. See *Supplemental Table 3*.

There is a tendency for infants born to teenage mothers and nonwhite mothers to experience a low birthweight. A low birthweight child is defined as weighing 2,500 grams or less. This is equivalent to 5.5 pounds or less. This measure is replacing the period of gestation as a better indicator of neonatal health and chances of survivability. A grams to pounds and ounces chart is provided in the Appendix section. Among mothers 19 years and younger, approximately one twelfth (8.44 percent) of the infants born were low birthweight infants. Whereas among women 20 years of age and older the percent of low birthweight infants was 6.77 percent. Nonwhite infants are more likely to be of low birthweight than a white infant. One of every nine nonwhite infants born is a low birthweight infant (11.81 percent). For white infants, the ratio is one out of every 15.3 or 6.5 percent.

BIRTH SUPPLEMENTAL TABLE 3
DISTRIBUTION OF BIRTHS BY AGE OF MOTHER , 1980 & 1985

Age of Mother	% of Females in Age Group to Total Female Population 1980	% of Females in Age Group to Total Female Population 1984	Percent of Births by Age of Mother 1980	Percent of Births by Age of Mother 1985
15-19	9.11	8.21	20.70	17.26
20-24	9.17	8.64	36.14	34.43
25-29	8.31	8.48	27.06	29.17
30-34	7.46	7.85	11.88	14.20
35-39	5.91	6.87	3.14	3.97
40-44	5.10	5.61	0.65	0.57

The trimester in which a woman starts to receive prenatal care is also an important determinant of the infant's health. Married women are much more likely to receive prenatal care within the first trimester than nonmarried women. Older pregnant women are more likely to begin early prenatal care. This is particularly true for white women as opposed to nonwhite women. However, even though nonwhite women tend to delay beginning prenatal care until the second trimester, the percentage of both white and nonwhite women receiving prenatal care within the first two trimesters is very close. In 11 of the 15 districts over ninety percent of the women received prenatal care during the first six months of their pregnancy. The highest percentage was in District 6 with 96.52 percent receiving prenatal care, and the lowest was 69.33 percent in District 4.

Supplemental Table 4 shows the number of live births statewide and for each district. The percentage is for the number of women who began prenatal care during one of the first two trimesters.

Supplemental Table 5 shows the number of stillbirths statewide and for each district. The percentage is for the number of women who began prenatal care during one of the first two trimesters.

There are several widely circulated reasons why women may delay receiving prenatal care. One is the unavailability of a prenatal care facility within a reasonable traveling distance. Related to this reason is the condition of the local transportation network and the availability of a public mass transportation system. The necessity for prenatal care may be unknown to some pregnant women, while others may not be able to afford the cost or may be ineligible to receive free or reduced cost prenatal care.

BIRTH SUPPLEMENTAL TABLE 4
NUMBER OF LIVE BIRTHS AND PERCENT OF MOTHERS WHO RECEIVED PRENATAL CARE BEFORE THE THIRD TRIMESTER OF PREGNANCY

District 6	106	88.68	District 14	17	76.47
District 7	27	85.19	District 15	64	73.44

There are some caveats to interpreting this data. The first is that the universe of data are in some cases incomplete and inaccurate. The data are dependent upon the mother's recall. The data on prenatal care a mother received are classified according to her residency and not by the location at which the prenatal care was provided. The data do not specify the exact time within the trimester that a woman began prenatal care, e. g., if a woman began prenatal care on the first day of the fourth month or the last day of the sixth month it would still count as beginning in the second trimester.

[1]National data are provisional and will be revised. National vital statistics data are available from the U. S. Department for Health and Human Services, Public Health Service, National Center for Health Statistics, 3700 East-West Highway, Hyattsville, Maryland 20782. In order to receive the publication, 'Monthly Vital Statistics Report', contact the NCHS by calling (301) 436-8500.

1985 DEATH STATISTICS ANALYSIS

There were 34,807 deaths in Kentucky in 1985. The death rate was 9.3 per 1,000 total population. This represented an increase in both the number of deaths and the death rate when compared to 1984 data. The highest rate of death for Kentucky was 10.4 which occurred in both 1963 and 1972. The lowest death rate was 8.9 which occurred in 1982. Death rates of all types - resident, fetal, infant, and neonatal - decreased from 1980 to 1984. Variations occurred year to year in the number of total deaths and the death rate.

The number of fetal deaths in 1985 was 446 which is a rate of 8.5 per 1,000 live births. The 1985 data on fetal deaths shows an increase from the 1984 rate of 7.9. This is the first time since 1980 that the fetal death rate has risen. With a few exceptions, the number of fetal deaths have declined each year since 1951.

Infant deaths fell from 616 in 1984 to 592 in 1985. The infant death rate was also down, from 11.6 to 11.2 per 1,000 live births. The 1985 infant death rate, the lowest in 35 years, is less than one third of what it was in 1950.

There was a very slight increase in the number of neonatal deaths from 1984 (397 deaths) to 1985 (399 deaths). The neonatal death rate edged upward from 7.4 to 7.6 per 1,000 live births. Despite this increase, the 1985 neonatal death rate was approximately one third of the 1950 neonatal death rate.

The supplemental tables below display the death rates by age group and the leading causes of death for these age groups, both statewide and for each Area Development District (ADD). The rates shown are crude death rates and are based on the total population in each age group. The age specific death rates are figured per 100,000 population in those age groups while the rate for all ages is per 1,000 total population. There are eleven age groups used for showing these data; under 1 year, 1-4 years, 5-9 years, 10-14 years, 15-24 years, 25-34 years, 35-44 years, 45-54 years, 55-64 years, 65-74 years, and 75 years and older. There has been a decline in the number of deaths for most of these age groups. In fact, from 1984 to 1985 there was an increase in the number of deaths in only three of the age groups; 35-44, 65-74, and 75 and older. These same three age groups reflect an increase in the number of deaths compared to 1980 data. These increases outweighed the decline in the number of deaths among the other eight age groups and caused the total number of deaths statewide to show an overall increase in 1985.

The death rates vary widely among age groups and between districts. *Supplemental Table 1* shows the districts with the lowest and the highest death rate for each age group. District 8 had the highest death rate for the under 1 and 1-4 year age groups, and the lowest rate for the age groups 35-44 and 45-54. The districts in the western section of the state had the lowest death rates for persons in the first three age groups; under

1 year, 1-4 years, and 5-9 years. District 2 claims the lowest rate of death for persons under 1 year of age and the highest death rate for persons in the age groups 65-74 years, and 75 and older.

DEATH SUPPLEMENTAL TABLE 1

The 1985 Kentucky death rate for white males was 10.3 and 9.9 for nonwhite males. In six of the fifteen districts the death rate for nonwhite males was higher than the rate of death for white males, and in District 6 the death rates for white and nonwhite males were the same. The death rate for white males ranged from 8.3 in District 5 to 12.7 in District 1. The death rate for nonwhite males ranged from 2.9 in District 12 to 16.2 in District 8. Refer to *Supplemental Table 2* for more information.

DEATH SUPPLEMENTAL TABLE 2
1985 MALE DEATH RATES BY RACE

AREA	WHITE MALE	NONWHITE MALE	AREA	WHITE MALE	NONWHITE MALE
Kentucky	10.3	9.9	District 8	11.8	16.2
District 1	12.7	15.7	District 9	10.3	11.3
District 2	11.5	9.2	District 10	10.1	7.6

District 4	11.2	11.8	District 12	11.0	2.9
District 5	8.3	4.5	District 13	10.8	10.3
District 6	10.0	10.0	District 14	12.2	9.6
District 7	10.0	8.2	District 15	9.1	10.8

There was little difference between the statewide death rates for white females and nonwhite females in 1985. The rate of death for white females was 8.5 and for nonwhite females it was 8.7. In five of the fifteen districts the death rate for white females was higher than for nonwhite females. From district to district the white females death rates ranged from a low of 7.2 in District 11 to a high of 11.2 in District 1, while the nonwhite females death rates ranged from 3.8 in District 5 to 15.9 in District 10. See *Supplemental Table 3* for the complete set of data.

DEATH SUPPLEMENTAL TABLE 3
1985 FEMALE DEATH RATES BY RACE

AREA	WHITE FEMALE	NONWHITE FEMALE	AREA	WHITE FEMALE	NONWHITE FEMALE
Kentucky	8.5	8.7	District 8	9.7	13.9
District 1	11.2	10.8	District 9	7.8	13.7
District 2	10.4	10.0	District 10	8.5	15.9
District 3	8.4	10.7	District 11	7.2	5.6
District 4	8.6	9.3	District 12	7.3	11.0
District 5	7.3	3.8	District 13	8.1	9.7
District 6	8.7	8.3	District 14	8.6	10.6
District 7	9.3	11.4	District 15	7.5	8.7

Heart diseases, malignant neoplasms, and cerebrovascular disease were the three most frequent causes of death in Kentucky and in all but two of the districts in 1985. Accidents was the third leading cause of death in District 11 and District 12. The percentages expressed in this paragraph relate to the number of persons who died within a specified district. For example, of the 4,740 persons who died in District 15, 36.75 percent died from heart disease. There were 34,807 total deaths in Kentucky in 1985 with heart diseases being responsible for 37.64 percent of the total, malignant neoplams for 21.65 percent, and cerebrovascular disease for 7.78 percent. The district with the highest percent of residents dying from heart disease was District 8 with 44.73 percent, with District 12 having the second highest percent of 42.19. The lowest percentage of resident deaths due to heart disease occurred in District 6 (35.11%), although this district had the highest percentage of deaths from malignant neoplasms (24.13%). Deaths from cerebrovascular disease ranged from 5.28 percent in District 12 to 10.26 in District 4. *Supplemental Table 4* shows the percentages of resident deaths from these three causes in addition to the other three leading causes of death - accidents, influenza and pneumonia, and suicides - for the state and for each district.

DEATH SUPPLEMENTAL TABLE 4
PERCENT OF DEATHS FROM MAJOR CAUSES, KENTUCKY 1985

AREA	TOTAL NUMBER OF DEATHS	PERCENT OF DEATHS FROM MAJOR CAUSES					
		HEART DISEASES	MALIGNANT NEOPLASMS	CEREBRO-VASCULAR DISEASE	ACCIDENTS	INFLUENZA & PNEUMONIA	SUICIDES
Kentucky	34,807	37.64	21.65	7.78	4.39	3.64	1.41
District 1	2,141	39.23	21.21	9.86	3.32	4.39	1.54

District 5	1,642	38.12	22.78	8.65	4.93	4.38	1.52
District 6	7,502	35.11	24.13	7.12	3.55	3.35	1.39
District 7	3,058	35.74	23.15	7.78	3.86	4.61	1.47
District 8	588	44.73	18.20	7.48	3.57	1.87	1.36
District 9	612	35.62	21.57	7.35	5.88	2.94	0.82
District 10	1,314	39.65	23.52	9.21	3.73	2.36	1.07
District 11	1,571	40.99	18.65	6.43	6.94	2.23	1.34
District 12	1,249	42.19	18.09	5.28	6.16	4.08	1.60
District 13	2,202	39.19	19.75	7.54	5.50	3.04	1.09
District 14	1,841	38.73	20.37	7.60	4.78	4.35	1.30
District 15	4,740	36.75	22.49	7.05	4.37	3.61	1.71

Since 1980, the percent of people who have died from heart diseases has fallen from 39.46 percent to 37.64 percent. A similar drop has occurred in deaths from cerebrovascular disease. In 1980, 9.32 percent of all deaths statewide were due to cerebrovascular disease. In 1985, that percentage dropped to 7.78. However, there has been an increase in the percent of persons dying from malignant neoplasms, from 19.90 percent in 1980 to 21.65 percent in 1985. There was also a slight increase in the percent of people who died as a result of suicide in 1985, 1.41 percent compared to 1.39 percent in 1980.

*CRUDE RATE AND AGE GROUP SPECIFIC RATES FOR DEATHS FROM 'ALL CAUSES' ARE PER 1,000 POPULATION; RATES FOR SPECIFIC CAUSES ARE PER 100,000 POPULATION.
NOTE: HOMICIDE INCLUDES LEGAL INTERVENTION

When reviewing the ten leading causes of death by race and sex, certain variations are seen. For each group, the top three causes of death were heart diseases, malignant neoplasms, and cerebrovascular disease, in that order. Other leading causes of death for all four of these groups included influenza and pneumonia, accidents, and diabetes mellitus. Suicide ranked as a leading cause of death for both white and nonwhite males. However, the rate of death for white males ranked higher than the rate for nonwhite males. Nonwhite males and females were more likely to die from certain causes in early infancy than white males and females. Two causes of death were peculiar to white males in 1985; cirrhosis of the liver and diseases of the arteries, arterioles, and capillaries. Homicide was the sixth leading cause of death among nonwhite males in 1985, while septicemia and hernia were principal causes of death affecting white females and hypertension ranked high as a cause of death for nonwhite females.

As shown in *Supplemental Table 5*, heart disease is one of the five leading causes of death in all age groups. Malignant neoplasms appears as a leading cause of death in all age groups except in the under 6 group. Accidents were the most likely cause of death for persons in the 6-14, 15-24, and 25-34 age groups, with suicides the second leading cause of death for the 15-24 and 25-34 groups. Malignant neoplasms were the primary cause of death for persons 35 through 64, followed by heart disease as the second leading cause. With persons 65 and older the order is reversed, with heart disease the leading cause followed by deaths due to malignant neoplasms.

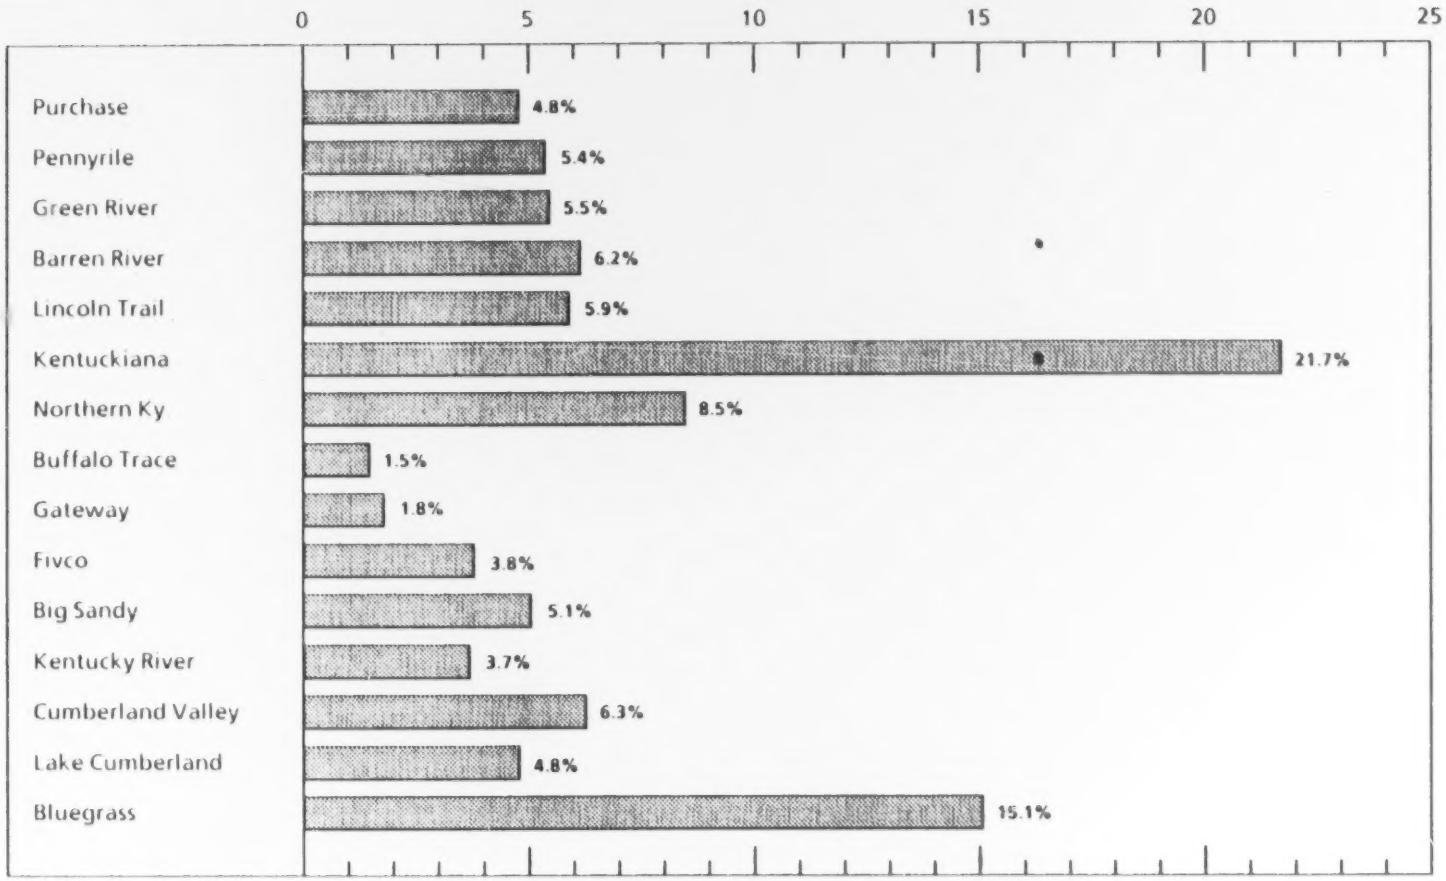
APPENDIX - FIGURE 3

PERCENT OF POPULATION BY DISTRICT
KENTUCKY 1984



NOTES

VITAL STATISTICS GLOSSARY

Birth Weight - The weight of a neonate determined immediately after delivery or as soon thereafter as feasible. It should be expressed to the nearest gram. This weight should be measured preferably within the first hour of life before significant postnatal weight loss has occurred.

Cause of Death - Deaths, by cause, are classified according to the International Classification of Diseases, Ninth Revision, of the World Health Organization.

Childbearing Age - Women 15 through 44 years of age.

Fetal Death (Stillbirth) - Death prior to the complete expulsion or extraction from the mother of a product of human conception, fetus and placenta, irrespective of the duration of the pregnancy; the death is indicated by the fact that, after such expulsion or extraction, the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of the voluntary muscles. This definition excludes induced terminations of pregnancy.

Gestation Age - The number of completed weeks that have elapsed between the first day of the last normal menstrual period (not the presumed time of conception) and the date of delivery, irrespective of whether the gestation results in a live birth or a fetal death.

Infant Death - Any death at any time from birth up to, but not including, one year of age (364 days, 23 hours, and 59 minutes from the moment of birth).

Live Birth - The complete expulsion or extraction from the mother of a product of human conception, irrespective of the duration of the pregnancy, which, after such expulsion or extraction, breathes or shows any evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles whether or not the umbilical cord has been cut or the placenta is attached.

Low Weight Birth - Any neonate, regardless of gestation age, whose weight at birth is 2,500 grams or less.

Maternal Death - The death of a woman while pregnant or within 42 days after termination of pregnancy, irrespective of the duration and the site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes.

Multiple Causes of Death - All those diseases, morbid conditions or injuries which either resulted in or contributed to death and the circumstances of the accident or violence which produced any such injuries.

Neonate - A liveborn infant.

Neonatal Death - Death of a liveborn neonate before the neonate becomes 28 days old (up to and including 27 days, 23 hours, and 59 minutes from the the moment of birth).

Perinatal Deaths - All fetal deaths of 20 or more weeks' gestation, plus deaths under 1 week.

Place of Occurrence - The place where the event occurred (regardless of place of residence).

Postneonatal Death - A death of an infant 28 days or more but under one year of age.

Race - The terms "white" and "nonwhite" are used to denote the racial groups. Definitions used for classifying race are those specified by the Bureau of the Census.

Residence Data - Data compiled according to the usual place of residence of the person to whom the event occurred without regard to the geographic place of occurrence. For births, infant deaths, and fetal deaths, the residence is defined as the mother's usual place of residence. (Resident data for Kentucky include events which occurred to residents of the Commonwealth irrespective of where event took place.)

Total Births - The total number of deliveries, live births plus fetal deaths.

Underlying Cause of Death - The underlying cause of death is either the disease or injury which initiated the train of events leading directly to death or the circumstances of the accident or violence which produced the fatal injury.

VITAL STATISTIC RATES

Age Adjusted Death Rate = Total number of expected deaths in a standard population (if the persons in this population had experienced the same age specific death rate as the population being adjusted) x 100,000 / Total Standard Population (based on the 1970 U.S. standard population)

Age Specific Birth Rate = Number of live births to women in specific age group x 1,000 / Estimated female population in that age group

Age Specific Death Rate = Number of deaths in specific age group x 100,000 / Estimated population in that age group

Cause Specific Death Rate = Number of deaths from a specific cause x 100,000 / Estimated total population

Crude Birth Rate = Number of live births x 1,000 / Estimated total population

Crude Death Rate = Number of deaths x 1,000 / Estimated total population

Divorce Rate = Number of divorces and annulments x 1,000 / Estimated total population

Fertility Rate = Number of live births x 1,000 / Female population 15-44 years of age

Fetal Death Rate = Number of fetal deaths x 1,000 / Total number of live births

Infant Death Rate = Number of deaths under 1 year of age x 1,000 / Total number of live births

Low Weight Birth Rate = $\frac{\text{Number of live births weighing 2,500 grams or less} \times 100}{\text{Total number of live births}}$

Marriage Rate = $\frac{\text{Number of marriages} \times 1{,}000}{\text{Estimated total population}}$

Maternal Death Rate = $\frac{\text{Number of deaths due to complications of pregnancy and childbirth} \times 10{,}000}{\text{Total number of live births}}$

Neonatal Death Rate = $\frac{\text{Number of deaths under 28 days of age} \times 1{,}000}{\text{Total number of live births}}$

Nonmarried Birth Rate = $\frac{\text{Number of births to nonmarried women} \times 1{,}000}{\text{Total number of births}}$

Perinatal Death Rate = $\frac{\text{Number of fetal deaths and deaths under 1 week} \times 1{,}000}{\text{Total number of births}}$

CAUSE OF DEATH CODES

In tables 2-I, 2-J, and 2-N, data for selected causes of death are provided. The cause of death and relevant ICD codes are listed below. The source of the ICD codes is International Classification of Diseases, 1975 Revision, World Health Organization.

Cause of Death	ICD Codes
Heart Diseases	390-398, 402, 404, 410-416, 421-429
Malignant Neoplasms	140-208
Cerebrovascular Disease	430-438
Accidents	E800-E949
Influenza & Pneumonia	480-487
Diabetes Mellitus	250
Suicide	E950-E959
Arteriosclerosis	440
Nephritis & Nephrosis	580-589
Cirrhosis of Liver	571
Arteries, Arterioles, Capillaries	441-448
Certain Causes in Early Infancy	760-779
Septicemia	038
Homicide (Includes Legal Intervention)	E960-E978
Congenital Anomalies	740-759
Emphysema	492
Hernia & Intestinal Obstruction	550-560
Symptoms & Ill-Defined Conditions	780-799
Hypertension	401, 403
Disorders of Gall Bladder	574-576

GRAMS TO POUNDS AND OUNCES CONVERSION CHART

Birth weight is replacing gestation period as an indicator of fetal mortality. Fetal mortality is the measure which indicates the likelihood that a pregnancy in a population group will result in a fetal death. Because of unfamiliarity with gram weights and a prevailing tendency to think in terms of pounds and ounces, a conversion chart is presented below for the convenience of the reader.

500 grams or less	=	Under 1 lb 2ozs
501 - 1,000 grams	=	1 lb 2 ozs - 2 lbs 3 ozs
1,001 - 1,500 grams	=	2 lbs 4 ozs - 3 lbs 4 ozs
1,501 - 2,000 grams	=	3 lbs 5 ozs - 4 lbs 6 ozs
2,001 - 2,500 grams	=	4 lbs 7 ozs - 5 lbs 8 ozs
2,501 - 3,000 grams	=	5 lbs 9 ozs - 6 lbs 9 ozs
3,001 - 3,500 grams	=	6 lbs 10 ozs - 7 lbs 11 ozs
3,501 - 4,000 grams	=	7 lbs 12 ozs - 8 lbs 13 ozs
4,001 - 4,500 grams	=	8 lbs 14 ozs - 9 lbs 14 ozs
4,501 - 5,000 grams	=	9 lbs 15 ozs - 11 lbs 0 ozs
5,001 grams or more	=	11 lbs 1 oz and over
